Chapter 1. About This Document

This guide describes how to provision the end-user Trafodion binaries on top of an existing Hadoop environment. This install allows you to store and query data using Trafodion, either via Trafodion clients (see Trafodion Client Installation Guide or via application code you write.

If you want to install a Trafodion developer-build environment, then please refer to the Trafodion Contributor Guide for instructions.

1.1. Intended Audience

This guide assumes that you are well-versed in Linux and Hadoop administration. If you don't have such experience, then you should consider going through the steps required to install a Hadoop environment before attempting to install Trafodion.

The instructions contained herein apply to the following environments.

- **Single-Node Environments**: Typically used when you want to evaluate Trafodion.
- **Cluster (Multi-Node) Environments**: Typically used when you deploy Trafodion for application usage.

Trafodion can be provisioned on a single-node or multi-node environment. Unless specifically noted, the term cluster is used to mean both single- and multi-node environments.

The provisioning instructions applies to a diverse set of platforms:

- **Virtual Machines**: Often used for evaluations and Trafodion development.
- **Cloud**: Used for Product Environments as well as for Developer Environments.
- **Bare Metal**: Used for Product Environments as well as for Developer Environments.

The term node is used to represent a computing platform on which operating system, Hadoop, and Trafodion software is running. Unless specifically qualified (bare-metal node, virtual-machine node, or cloud-node), node represents a computing platform in your cluster regardless of platform type.

1.2. New and Changed Information

This is a new guide.
1.3. Notation Conventions

This list summarizes the notation conventions for syntax presentation in this manual.

- **UPPERCASE LETTERS**

  Uppercase letters indicate keywords and reserved words. Type these items exactly as shown. Items not enclosed in brackets are required.

  ```
  SELECT
  ```

- **lowercase letters**

  Lowercase letters, regardless of font, indicate variable items that you supply. Items not enclosed in brackets are required.

  ```
  file-name
  ```

- **[ ] Brackets**

  Brackets enclose optional syntax items.

  ```
  DATETIME [start-field TO] end-field
  ```

  A group of items enclosed in brackets is a list from which you can choose one item or none.

  The items in the list can be arranged either vertically, with aligned brackets on each side of the list, or horizontally, enclosed in a pair of brackets and separated by vertical lines.

  For example:

  ```
  DROP SCHEMA schema [CASCADE]
  DROP SCHEMA schema [ CASCADE | RESTRICT ]
  ```
• { } Braces

Braces enclose required syntax items.

FROM { grantee [, grantee ] ... }

A group of items enclosed in braces is a list from which you are required to choose one item.

The items in the list can be arranged either vertically, with aligned braces on each side of the list, or horizontally, enclosed in a pair of braces and separated by vertical lines.

For example:

INTERVAL { start-field TO end-field }
{ single-field }
INTERVAL { start-field TO end-field | single-field }

• | Vertical Line

A vertical line separates alternatives in a horizontal list that is enclosed in brackets or braces.

{expression | NULL}

• ... Ellipsis

An ellipsis immediately following a pair of brackets or braces indicates that you can repeat the enclosed sequence of syntax items any number of times.

ATTRIBUTE[S] attribute [, attribute] ...
{, sql-expression } ...

An ellipsis immediately following a single syntax item indicates that you can repeat that syntax item any number of times.

For example:

expression-n ...

• Punctuation
Parentheses, commas, semicolons, and other symbols not previously described must be typed as shown.

```
DAY (datetime-expression)
@script-file
```

Quotation marks around a symbol such as a bracket or brace indicate the symbol is a required character that you must type as shown.

For example:

```
"{" module-name [, module-name] ... "}" 
```

**• Item Spacing**

Spaces shown between items are required unless one of the items is a punctuation symbol such as a parenthesis or a comma.

```
DAY (datetime-expression) DAY(datetime-expression)
```

If there is no space between two items, spaces are not permitted. In this example, no spaces are permitted between the period and any other items:

```
myfile.sh
```

**• Line Spacing**

If the syntax of a command is too long to fit on a single line, each continuation line is indented three spaces and is separated from the preceding line by a blank line.

This spacing distinguishes items in a continuation line from items in a vertical list of selections.

```
match-value [NOT] LIKE _pattern
[ESCAPE esc-char-expression]
```

### 1.4. Comments Encouraged

We encourage your comments concerning this document. We are committed to providing documentation that meets your needs. Send any errors found, suggestions for improvement, or compliments to user@trafodion.incubator.apache.org.
Include the document title and any comment, error found, or suggestion for improvement you have concerning this document.
Chapter 2. Introduction

Trafodion is a Hadoop add-on service that provides transactional SQL on top of HBase. Typically, you use Trafodion as the database for applications that require Online Transaction Processing (OLTP), Operational Data Store (ODS), and/or strong reporting capabilities. You access Trafodion using standard JDBC and ODBC APIs.

You may choose whether to add Trafodion to an existing Hadoop environment or to create a standalone Hadoop environment specifically for Hadoop.

This guide assumes that a Hadoop environment exists upon which your provisioning Trafodion. Refer to Hadoop Software for information about what Hadoop software is required Trafodion.

2.1. Security Considerations

The following users need be considered for Trafodion:

- **Provisioning User**: A Linux-level user that performs the Trafodion provisioning tasks. This user ID requires `sudo` access and passwordless ssh among the nodes where Trafodion is installed. In addition, this user ID requires access to Hadoop distribution, HDFS, and HBase administrative users to change respective environment's configuration settings per Trafodion requirements. Refer to Trafodion Provisioning User for more information about the requirements and usage associated with this user ID.

- **Runtime User**: A Linux-level user under which the Trafodion software runs. This user ID must be registered as a user in the Hadoop Distributed File System (HDFS) to store and access objects in HDFS, HBase, and Hive. In addition, this user ID requires passwordless access among the nodes where Trafodion is installed. Refer to Trafodion Runtime User for more information about this user ID.

- **Trafodion Database Users**: Trafodion users are managed by the Trafodion security features (grant, revoke, etc.), which can be integrated with LDAP if so desired. These users are referred to as database users and do not have direct access to the operating system. Refer to Register User, Grant, and other SQL statements in the Trafodion SQL Reference Manual for more information about managing Trafodion Database Users.

Optionally, you can enable Trafodion Security. If you do not enable security in Trafodion, then a client interface to Trafodion may request a user name and password, but Trafodion ignores the user name and password entered in the client interface, and the session runs as the database root user, DB__ROOT, without restrictions. If you want to restrict users, restrict access to certain users only, or restrict access to an object or operation, then you must enable security, which enforces authentication and authorization. Refer to Enable Security for more information about this option.
2.2. Provisioning Options

Trafodion ships with a set of scripts (the Trafodion Installer) that takes care of many of the installation and upgrade tasks associated with the Trafodion software and its requirements. There is a separate set of scripts to remove Trafodion, if needed.

Currently, the Trafodion Installer is able to install Trafodion on select Cloudera and Hortonworks Hadoop distributions only. The Trafodion Installer limitations are noted as they apply in the different chapters below. For example, the Trafodion Installer is less capable on SUSE than it is on RedHat/CentOS; you have to install the prerequisite software packages outside the Trafodion Installer.

The Trafodion Installer automates many of the tasks required to install/upgrade Trafodion, spanning from downloading and installing required software packages and making required changes to your Hadoop environment via creating the Trafodion runtime user ID to installing and starting Trafodion. It is, therefore, highly recommend that you use the Trafodion Installer for initial installation and upgrades of Trafodion. These steps are referred to as “Script-Based Provisioning” in this guide. Refer to Trafodion Installer provides usage information.

If, for any reason, you choose not to use the Trafodion Installer, then separate chapters provide step-by-step recipes for the tasks required to install/upgrade Trafodion. These steps are referred to as Recipe-Based Provisioning in this guide. It is assumed that you are well-versed in Linux and Hadoop administrative tasks if using Recipe-Based Provisioning.

2.3. Provisioning Activities

Trafodion provisioning is divided into the following main activities:

- **Requirements**: Activities and documentation required to install the Trafodion software. These activities include tasks such as understanding hardware and operating system requirements, Hadoop requirements, what software packages that need to be downloaded, configuration settings that need to be changed, user IDs requirements, and so on.

- **Prepare**: Activities to prepare the operating system and the Hadoop ecosystem to run Trafodion. These activities include tasks such as installing required software packages, configure the Trafodion Installation User, gather information about the Hadoop environment, modify configuration for different Hadoop services, and so forth.

- **Install**: Activities related to installing the Trafodion software. These activities include tasks such as unpacking the Trafodion tar files, creating the Trafodion Runtime User, creating Trafodion HDFS directories, installing the Trafodion software, and so forth.
Upgrade: Activities related to the upgrading the Trafodion software. These activities include tasks such as shutting down Trafodion, installing a new version of the Trafodion software, and so on. The upgrade tasks vary depending on the differences between the current and new release of Trafodion. For example, an upgrade may or may not include an upgrade of the Trafodion metadata.

Activate: Activities related to starting the Trafodion software. These activities include basic management tasks such as starting and checking the status of the Trafodion components, performing basic smoke tests, and so forth.

Remove: Activities related to removing Trafodion from your Hadoop cluster.

2.4. Provisioning Master Node

All provisioning tasks are performed from a single node in the cluster, which must be part of the Hadoop environment you’re adding Trafodion to. This node is referred to as the “Provisioning Master Node” in this guide.

The Trafodion Provisioning User must have access to all other nodes from the Provisioning Master Node in order to perform provisioning tasks on the cluster.

2.5. Trafodion Installer

The Trafodion Installer is a set of scripts automates most of the tasks requires to install/upgrade Trafodion. You download the Trafodion Installer tar file from the Trafodion download page. Next, you unpack the tar file.

Example

```bash
$ mkdir $HOME/trafodion-installer
$ cd $HOME/trafodion-downloads
$ tar -zxf apache-trafodion-installer-1.3.0-incubating-bin.tar.gz -C $HOME/trafodion-installer
$ ls $HOME/trafodion-installer/installer
bashrc_default tools traf_config_check
trafodion_apache_hadoop_install traf_package_setup
build-version-1.3.0.txt traf_add_user traf_config_setup
trafodion_config_default traf_setup
dcs_installer traf_apache_hadoop_config_setup traf_create_systemdefaults
trafodion_install traf_sqconfig
rest_installer traf_authentication_conf_default traf_getHadoopNodes
trafodion_license traf_start
setup_known_hosts.exp traf_cloudera_mods98
trafodion_uninstaller traf_hortonworks_mods98
$```
The Trafodion Installer supports two different modes:

1. **Guided Setup**: Prompts for information as it works through the installation/upgrade process. This mode is recommended for new users.

2. **Automated Setup**: Required information is provided in a pre-formatted bash-script configuration file, which is provided via a command argument when running the Trafodion Installer thereby suppressing all prompts.

A template of the configuration file is available here within the installer directory: `trafodion_config_default`. Make a copy of the file in your directory and populate the needed information.

Automated Setup is recommended since it allows you to record the required provisioning information ahead of time. Refer to **Automated Setup** for information about how to populate this file.

### 2.5.1. Usage

The following shows help for the Trafodion Installer.

```
./trafodion_install --help
```

This script will install Trafodion. It will create a configuration file (if one has not been created), setup of the environment needed for Trafodion, configure HBase with Hbase-trx and co-processors needed, and install a specified Trafodion build.

Options:
- `--help`: Print this message and exit
- `--accept_license`: If provided, the user agrees to accept all the provisions in the Trafodion license. This allows for automation by skipping the display and prompt of the Trafodion license.
- `--config_file`: If provided, all install prompts will be taken from this file and not prompted for.
2.5.2. Install vs. Upgrade

The Trafodion Installer automatically detects whether you're performing an install or an upgrade by looking for the Trafodion Runtime User in the `/etc/passwd` file.

- If the user ID doesn't exist, then the Trafodion Installer runs in install mode.
- If the user ID exists, then the Trafodion Installer runs in upgrade mode.

2.5.3. Guided Setup

By default, the Trafodion Installer runs in Guided Setup mode, which means that it prompts you for information during the install/upgrade process.

Refer to the following sections for examples:

- Guided Install
- Guided Upgrade

2.5.4. Automated Setup

The `--config_file` option runs the Trafodion in Automated Setup mode.

Before running the Trafodion Installer with this option, you do the following:

1. Copy the `trafodion_config_default` file.

   Example

   ```
   cp trafodion_config_default my_config
   ```

2. Edit the new file using information you collect in the Gather Configuration Information section in the Prepare chapter.

3. Run the Trafodion Installer in Automated Setup Mode

   Example

   ```
   ./trafodion_installer --config_file my_config
   ```
Your Trafodion Configuration File contains the password for the Trafodion Runtime User and for the Distribution Manager. Therefore, we recommend that you secure the file in a manner that matches the security policies of your organization.

**Example: Creating a Trafodion Configuration File**

Using the instructions in **Gather Configuration Information** in the **Prepare** chapter, you record the following information.

<table>
<thead>
<tr>
<th>ID</th>
<th>Information</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMIN</td>
<td>Administrator user name for Apache Ambari or Cloudera Manager.</td>

Chapter 3. Requirements

Trafodion requires an x86 version of Linux.

The current release of Trafodion has been tested with:

- 64-bit Red Hat Enterprise Linux (RHEL) or CentOS 6.5, 6.6, and 6.7
- SUSE SLES 11.3
- Cloudera CDH 5.2
- Cloudera CDH 5.3
- Hortonworks HDP 2.2

Other OS releases may work, too. The Trafodion project is currently working on better support for non-distribution version of Hadoop.

3.1. General Cluster and OS Requirements and Recommendations

64-bit x86 instruction set running a Linux distribution is required. Further, Trafodion assumes an environment based on the requirements of the tested Hadoop distributions/services.

3.1.1. Hardware Requirements and Recommendations

Single-Node Cluster

It is possible to run Trafodion on a single-node sandbox environment. Typically, any sandbox running a Hadoop distribution can be used. A typical single-node configuration uses 4-8 cores with 16 GB of memory, and 20 GB free disk space.

Multi-Node Cluster

For multi-node end-user clusters, your typical HBase environment should suffice for Trafodion. Typically, memory configuration range between 64-128 GB per node with minimum requirement of 16 GB. The cluster size can span from 1 to \( n \) nodes; a minimum of two nodes is recommended. A minimum of two cores is required regardless of whether you’re deploying Trafodion on a bare-metal or virtual environment.
Recommended configurations:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processors per Node</td>
<td>• Small: 2 cores</td>
</tr>
<tr>
<td></td>
<td>• Medium: 4 cores</td>
</tr>
<tr>
<td></td>
<td>• Large: 8+ cores</td>
</tr>
<tr>
<td>Memory per Node</td>
<td>• Small: 16 GB</td>
</tr>
<tr>
<td></td>
<td>• Medium: 64 GB</td>
</tr>
<tr>
<td></td>
<td>• Large: 128 GB</td>

<tr>
<td></td>
<td>• Two Medium Nodes: 64 concurrent queries</td>
</tr>
<tr>
<td></td>
<td>• Two Large Nodes: 256 concurrent queries</td>
</tr>
</tbody>
</table>

### 3.1.2. OS Requirements and Recommendations

Please verify these requirements on each node you will install Trafodion on:

<table>
<thead>
<tr>
<th>Function</th>
<th>Requirement</th>
<th>Verification Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>64-bit version of Red Hat 6.5 or later, or SUSE SLES 11.3 or later.</td>

<td>Available to run shell commands in parallel.</td>
<td>pdsh -V</td>
</tr>
<tr>
<td>pdcp</td>
<td>Available to copy files among nodes in parallel. part of the pdsh package.</td>
<td>pdcp -V</td>
</tr>
</tbody>
</table>

### 3.1.3. IP Ports

The following table lists the default ports used by the different Trafodion components plus the configuration file and configuration attribute associated with each port setting.

<table>
<thead>
<tr>
<th>Default Port</th>
<th>Configuration File</th>
<th>Configuration Entry</th>
<th>Required</th>
<th>Range</th>
<th>Protocol</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>4200</td>
<td>rest-site.xml</td>
<td>trafodion.rest.port</td>
<td>Yes</td>
<td>1</td>
<td>REST</td>
<td>Trafodion REST Server.</td>
</tr>
<tr>
<td>4201</td>
<td>rest-site.xml</td>
<td>trafodion.rest.https.port</td>
<td>Yes</td>
<td>1</td>
<td>HTTPS</td>
<td>Trafodion REST Server (HTTPS).</td>
</tr>
<tr>
<td>23400</td>
<td>dcs-site.xml</td>
<td>dcs.master.port</td>
<td>Yes</td>
<td>n</td>
<td>binary</td>
<td>Start of Trafodion DCS port range. (37800 for Trafodion 1.1)</td>
</tr>
<tr>
<td>24400</td>
<td>dcs-site.xml</td>
<td>dcs.master.info.port</td>
<td>Yes</td>
<td>1</td>
<td>HTTP</td>
<td>DCS master web GUI. (40010 for Trafodion 1.1)</td>
</tr>
<tr>
<td>24410</td>
<td>dcs-site.xml</td>
<td>dcs.server.info.port</td>
<td>Yes</td>
<td>n</td>
<td>HTTP</td>
<td>Start of range for DCS server web GUIs. (40020 for Trafodion 1.1)</td>
</tr>
<tr>
<td>50030</td>
<td>mapred-site.xml</td>
<td>mapred.job.tracker.http.address</td>
<td>No</td>
<td>1</td>
<td>HTTP</td>
<td>MapReduce Job Tracker web GUI.</td>
</tr>
<tr>
<td>50070</td>
<td>hdfs-site.xml</td>
<td>dfs.http.address</td>
<td>No</td>
<td>1</td>
<td>HTTP</td>
<td>HDFS Name Node web GUI.</td>
</tr>
<tr>
<td>50075</td>
<td>hdfs-site.xml</td>
<td>dfs.datanode.http.address</td>
<td>No</td>
<td>1</td>
<td>HTTP</td>
<td>HDFS Data Node web GUI.</td>
</tr>
<tr>
<td>50090</td>
<td>hdfs-site.xml</td>
<td>dfs.secondary.http.address</td>
<td>No</td>
<td>1</td>
<td>HTTP</td>
<td>HDFS Secondary Name Node web GUI.</td>
</tr>
<tr>
<td>60010</td>
<td>hbase-site.xml</td>
<td>hbase.master.info.port</td>
<td>No</td>
<td>1</td>
<td>HTTP</td>
<td>HBase Master web GUI.</td>
</tr>
<tr>
<td>60030</td>
<td>hbase-site.xml</td>
<td>hbase.regionserver.info.port</td>
<td>No</td>
<td>1</td>
<td>HTTP</td>
<td>HBase Region Server web GUI.</td>
</tr>
</tbody>
</table>

There are two port ranges used by Trafodion.

- 23400 is a range, to allow multiple mxosrsvr processes on each node. Allow a range of a few ports, enough to cover all the servers per node that are listed in the "servers" file in the DCS configuration directory.
• 24410 is a range as well, enough to cover the DCS servers per node, usually 1 or 2.

On top of the ports identified above, you also need the ports required by your Hadoop distribution. For example:

• **Cloudera Ports**

• **Hortonworks Ports**

Although not all the ports will be used on every node of the cluster, you need to open most of them for all the nodes in the cluster that have Trafodion, HBase, or HDFS servers on them.

### 3.2. Prerequisite Software

#### 3.2.1. Hadoop Software

Trafodion runs as an add-on service on Hadoop distributions. The following Hadoop services and their dependencies must be installed and running on the cluster where you intend to install Trafodion:

• Hadoop Distributed File System (HDFS)

• YARN with MapReduce version 2

• ZooKeeper

• HBase

• Hive

• Apache Ambari (Hortonworks) or Cloudera Manager (Cloudera) with associated embedded databases.

The following distributions have been tested with Trafodion.

<table>
<thead>
<tr>
<th>Distribution</th>
<th>Version</th>
<th>HBase Version</th>
<th>Installation Documentation</th>
</tr>
</thead>
</table>
| Cloudera Distribution Including Apache Hadoop (CDH)| 5.2 or 5.3| 0.98          | CHD 5.2 Installation
                                                      |           |               | [http://www.cloudera.com/downloads/manager/5-3-0.html](http://www.cloudera.com/downloads/manager/5-3-0.html) |
| Hortonworks Data Platform (HDP)                    | 2.2       | 0.98          | HDP 2.2 Installation                       |

1. Future releases of Trafodion will move away from distribution-specific integration. Instead, Trafodion will be tested with specific version of the Hadoop, HDFS, HBase, and other services/products only.

2. When possible, install using **parcels** to simply the installation process.
Trafodion does not yet support installation on a non-distribution version of Hadoop; that is, Hadoop downloaded from the Apache website. This restriction will be lifted in a later release of Trafodion.

3.2.2. Software Packages

In addition to the software packages required to run different Hadoop services listed above (for example, Java), Trafodion requires supplementary software to be installed on the cluster before it is installed. These are Linux tools that are not typically packaged as part of the core Linux distribution.

For RedHat/CentOS, the Trafodion Installer automatically attempts to get a subset of these packages over the Internet. If the cluster's access to the Internet is disabled, then you need to manually download the packages and make them available for installation. You need to build and install log4c++ manually.

<table>
<thead>
<tr>
<th>Package</th>
<th>Usage</th>
<th>Installation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EPEL</td>
<td>Add-on packages to completed the Linux distribution.</td>
<td>Download Fedora RPM</td>
</tr>
<tr>
<td>pdsh</td>
<td>Parallelize shell commands during install and Trafodion runtime utilities.</td>
<td>yum install pdsh</td>
</tr>
<tr>
<td>log4cxx</td>
<td>Message logging.</td>
<td>Manual process</td>
</tr>
<tr>
<td>sqlite</td>
<td>Internal configuration information managed by the Trafodion Foundation component.</td>
<td>yum install sqlite</td>
</tr>
<tr>
<td>expect</td>
<td>Not used?</td>
<td>yum install expect</td>
</tr>
<tr>
<td>perl-DBD-SQLite</td>
<td>Allows Perl scripts to connect to SQLite.</td>
<td>yum install perl-DBD-SQLite</td>
</tr>
<tr>
<td>perl-Params-Validate</td>
<td>Validates method/function parameters in Perl scripts.</td>
<td>yum install perl-Params-Validate</td>
</tr>
<tr>
<td>perl-Time-HiRes</td>
<td>High resolution alarm, sleep, gettimeofday, interval timers in Perl scripts.</td>
<td>yum install perl-Time-HiRes</td>
</tr>
<tr>
<td>protobuf</td>
<td>Data serialization.</td>
<td>yum install protobuf</td>
</tr>
<tr>
<td>xerces-c</td>
<td>C++ XML parsing.</td>
<td>yum install xerces-c</td>
</tr>
<tr>
<td>gzip</td>
<td>Data compress/decompress.</td>
<td>yum install gzip</td>
</tr>
<tr>
<td>rpm-build²</td>
<td>Build binary and source software packages.</td>
<td>yum install rpm-build</td>
</tr>
<tr>
<td>apr-devel²</td>
<td>Support files used to build applications using the APR library.</td>
<td>yum install apr-devel</td>
</tr>
<tr>
<td>apr-util-devel²</td>
<td>Support files used to build applications using the APR utility library.</td>
<td>yum install apr-util-devel</td>
</tr>
<tr>
<td>doxygen²</td>
<td>Generate documentation from annotated C++ sources.</td>
<td>yum install doxygen</td>
</tr>
<tr>
<td>gcc²</td>
<td>GNU Compiler Collection</td>
<td>yum install gcc</td>
</tr>
<tr>
<td>gcc_c++²</td>
<td>GNU C++ compiler.</td>
<td>yum install gcc_c++</td>
</tr>
</tbody>
</table>

1. log4c++ was recently withdrawn from public repositories. Therefore, you will need to build the log4c++ RPM on your system and then install the RPM using the procedure described in log4c++ Installation.
2. Software package required to build `log4c++`. Not required otherwise. These packages are not installed by the Trafodion Installer in this release.

The Trafodion Installer requires Internet access to install the required software packages.

### 3.3. Trafodion User IDs and Their Privileges

#### 3.3.1. Trafodion Runtime User

The `trafodion:trafodion` user ID is created as part of the installation process. The default password is: `traf123`.

Trafodion requires that either HDFS ACL support or Kerberos is enabled. The Trafodion Installer will enable HDFS ACL support. Kerberos-based security settings are outside the scope of this guide. Please refer to the security information in Apache HBase™ Reference Guide for information about how to set up HBase security with Kerberos.

Also, Trafodion requires `sudo` access to `ip` and `arping` so that floating or elastic IP addresses can be moved from one node to another in case of node failures.

> Do not create the `trafodion:trafodion` user ID in advance. The Trafodion Installer uses the presence of this user ID to determine whether you’re doing an installation or upgrade.

#### 3.3.2. Trafodion Provisioning User

Typically, the Trafodion Installer is used for Trafodion installations. It requires access to the user IDs documented below.

**Linux Installation User**

The user ID that performs the Trafodion installation steps. Typically, this User ID runs the Trafodion Installer.

**Requirements:**

- User name or group cannot be `trafodion`.
- Passwordless ssh access to all nodes in the cluster.
- Internet access to download software packages.
- `requiretty` must be disabled in `/etc/sudoers`.
- `sudo` access to:
• Download and install software packages.

• Modify /etc/sudoers.d (allow the trafodion user to modify floating IP: ip and arping).

• Create the trafodion user ID and group.

• Install Trafodion software into the HBase environment.

• Run Java version command on each node in the cluster.

• Run Hadoop version command on each node in the cluster.

• Run HBase version command on each node in the cluster.

• Create directories and files in:
  • /etc
  • /usr/lib
  • /var/log

• Invoke su to execute commands as other users; for example, trafodion.

• Edit sysctl.conf and activate changes using sysctl -p:
  • Modify kernel limits.
  • Reserve IP ports.

1 sudo is required in the current release of Trafodion. This restriction may be relaxed in later releases. Alternative mechanisms for privileged access (such as running as root or sudo alternative commands) are not supported.

Distribution Manager User

A user ID that can change the configuration using Apache Ambari or Cloudera Manager. The Trafodion Installer makes REST request to perform configuration and control functions to the distribution manager using this user ID.

Requirements:

• Administrator user name and password.

• URL to Distribution Manager’s REST API.

HDFS Administrator User

The HDFS super user. Required to create directories and change security settings, as needed. The Trafodion Installer uses su to run commands under this user ID.
Requirements:

- HDFS Administrator user name.
- Write access to home directory on the node where the Distribution Manager is running.

**HBase Administrator User**

The HBase super user. Required to change directory ownership in HDFS.

Requirements:

- HBase Administrator user name and group.
- Read access to hbase-site.xml.

### 3.4. Required Configuration Changes

Trafodion requires changes to a number of different areas of your system configuration: operating system, HDFS, and HBase.

These changes are performed by the Trafodion Installer, if used.

#### 3.4.1. Operating System Changes

/etc/security/limits.d/trafodion.conf on each node in the cluster must contain the following settings:

```bash
# Trafodion settings
trafodion soft core unlimited
trafodion hard core unlimited
trafodion soft memlock unlimited
trafodion hard memlock unlimited
trafodion soft nofile 32768
trafodion hard nofile 65536
trafodion soft nproc 100000
trafodion hard nproc 100000
```
3.4.2. ZooKeeper Changes

These changes require a restart of ZooKeeper on all nodes in the cluster.

Trafodion requires the following changes to zoo.cfg:

<table>
<thead>
<tr>
<th>Setting</th>
<th>New Value</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxClientCnxns</td>
<td>0</td>
<td>Tell ZooKeeper to impose no limit to the number of connections to enable better Trafodion concurrency.</td>
</tr>
</tbody>
</table>

3.4.3. HDFS Changes

These changes require a restart of HDFS on all nodes in the cluster.

Trafodion requires the following changes to the HDFS environment:

<table>
<thead>
<tr>
<th>Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Create /hbase-staging directory.</td>
<td></td>
</tr>
<tr>
<td>• Change owner to HBase Administrator.</td>
<td></td>
</tr>
<tr>
<td>• Create /bulkload directory.</td>
<td>Used to stage data when processing the Trafodion LOAD INTO table statement and as a temporary directory to create links to actual HFile for snapshot scanning.</td>
</tr>
<tr>
<td>• Change owner to trafodion.</td>
<td></td>
</tr>
<tr>
<td>• Create /lobs directory.</td>
<td></td>
</tr>
<tr>
<td>• Change owner to trafodion.</td>
<td></td>
</tr>
<tr>
<td>• Create /apps/hbase/data/archive1.</td>
<td></td>
</tr>
<tr>
<td>• Change owner to: hbase:hbase (Cloudera) or hbase:hdfs (Hortonworks)</td>
<td></td>
</tr>
<tr>
<td>• Give the trafodion user RWX access to /apps/hbase/data/archive</td>
<td></td>
</tr>
<tr>
<td>• Set default user of /apps/hbase/data/archive to trafodion</td>
<td></td>
</tr>
<tr>
<td>• Recursively change setafcl of /apps/hbase/data/archive to RWX</td>
<td></td>
</tr>
</tbody>
</table>

1. These steps are performed after HDFS ACLs have been enabled.

The following changes are required in hdfs-site.xml:

<table>
<thead>
<tr>
<th>Setting</th>
<th>New Value</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>dfs.namenode.acls.enabled</td>
<td>true</td>
<td>Enable HDFS POSIX Access Control Lists (ACLs).</td>
</tr>
</tbody>
</table>
3.4.4. HBase Changes

These changes require a restart of ZooKeeper and HBase on all nodes in the cluster.

Trafodion requires that the following changes to the HBase environment:

<table>
<thead>
<tr>
<th>Action</th>
<th>Affected Directories</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Install/replace Trafodion's version of hbase-trx | • /usr/lib/hbase/lib/  
• /usr/share/cmff/lib/plugins/ (Cloudera)  
• /usr/hdp/current/hbase-regionserver/lib/ (Hortonworks) | Trafodion transaction management relies on an enhanced version of hbase-trx. |
| Install/Replace Trafodion utility jar file. | • /usr/lib/hbase/lib/  
• /usr/share/cmff/lib/plugins/ (Cloudera)  
• /usr/hdp/current/hbase-regionserver/lib (Hortonworks) | TODO: Add purpose here. |

The following changes are required in hbase-site.xml. Please refer to the Apache HBase™ Reference Guide for additional descriptions of these settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>New Value</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>hbase.master.distributed.log.splitting</td>
<td>false</td>
<td>Do not use the HBase Split Log Manager. Instead, the HMaster controls all log-splitting activities.</td>
</tr>
<tr>
<td>hbase.hregion.impl</td>
<td>org.apache.hadoop.hbase.regionserver.transactional.TransactionalRegion</td>
<td>Trafodion needs to be able to read the Write Ahead Log from a coprocessor using the getScanner method. This method is protected in standard HBase. This change overloads the getScanner method to be public thereby allowing coprocessor code to use it.</td>
</tr>
<tr>
<td>hbase.regionserver.region.split.policy</td>
<td>org.apache.hadoop.hbase.regionserver.ConstantSizeRegionSplitPolicy</td>
<td>Tell HBase to use the ConstantSizeRegionSplitPolicy for region splitting. This setting causes region splitting to occur only when the maximum file size is reached.</td>
</tr>
<tr>
<td>hbase.snapshot.enabled</td>
<td>true</td>
<td>Enable the HBase Snapshot feature. Used for Trafodion backup and restore.</td>
</tr>
<tr>
<td>hbase.bulkload.staging.dir</td>
<td>hbase-staging</td>
<td>Use /hbase-staging as the bulk load staging directory.</td>
</tr>
</tbody>
</table>
### 3.5. Recommended Configuration Changes

The following configuration changes are recommended but not required.

The Trafodion Installer does not make these changes.

#### 3.5.1. Recommended Security Changes

The *trafodion* user ID should not be given other *sudo* privileges than what’s specified in this manual. Also, we recommend that this user ID is locked (*sudo passwd -l trafodion*) once the installation/upgrade activity has been completed. Users that need issue commands as the *trafodion* ID should do so using *sudo*; for example, *sudo -u trafodion -i*.

#### 3.5.2. Recommended HDFS Configuration Changes

These settings are configured in the *hadoop-env.sh* file.

<table>
<thead>
<tr>
<th>Property</th>
<th>Recommended Setting</th>
<th>Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>DataNode Java Heap Size</td>
<td>2 GB</td>
<td>Use this setting for a large configuration.</td>
</tr>
<tr>
<td>NameNode Java Heap Size</td>
<td>2 GB</td>
<td>Use this setting for a large configuration.</td>
</tr>
<tr>
<td>Secondary NameNode Java Heap Size</td>
<td>2 GB</td>
<td>Use this setting for a large configuration.</td>
</tr>
</tbody>
</table>
### 3.5.3. Recommended HBase Configuration Changes

<table>
<thead>
<tr>
<th>Configuration Property</th>
<th>Recommended Setting</th>
<th>Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>hbase.rpc.timeout</td>
<td>10 minutes</td>
<td>This setting depends on the tables' size. Sixty (60) seconds is the default. Increase this value for big tables. Make it the same value as hbase.client.scanner.timeout.period. We have found that increasing the setting to six-hundred (600) seconds will prevent many of the timeout-related errors we encountered, such as OutOfOrderNextException errors.</td>
</tr>
<tr>
<td>hbase.client.scanner.timeout.period</td>
<td>10 minutes</td>
<td>Similar to the hbase.rpc.timeout setting. Sixty (60) seconds is the default. Depending on the size of a user table, we have experienced timeout failures on count(*) and update statistics commands from this setting. The underlying issue is the length of the execution of the coprocessor within HBase. NOTE: HBase uses the smaller of hbase.rpc.timeout and hbase.client.scanner.timeout.period to calculate the scanner timeout.</td>
</tr>
<tr>
<td>hbase.snapshot.master.timeoutMillis and hbase.snapshot.region.timeout</td>
<td>10 minutes</td>
<td>HBase's default setting is 60000 milliseconds. If you experience timeout issues with HBase snapshots when you use the Trafodion Bulk Loader or other statements, you can set the value for these two HBase properties to 10 minutes (600,000 milliseconds).</td>
</tr>
<tr>
<td>hbase.hregion.max.filesize</td>
<td>107374182400 bytes</td>
<td>HBase's default setting is 10737418240 (10 GB). We have increased the setting to 107374182400 (100 GB), which reduces the number of HStoreFiles per table and appears to reduce disruptions to active transactions from region splitting.</td>
</tr>
<tr>
<td>hbase.regionserver.handler.count</td>
<td>&lt;num&gt;</td>
<td>This setting should match the number of concurrent sessions (mxosrvr). The default is 10.</td>
</tr>
</tbody>
</table>
Chapter 4. Prepare

You need to prepare your Hadoop environment before installing Trafodion.

1. Install Optional Workstation Software
2. Configure Installation User ID
3. Disable requiretty
4. Verify OS Requirements and Recommendations
5. Configure LDAP Identity Store
6. Gather Configuration Information
7. Install Required Software Packages
8. Perform Recipe-Based Provisioning Tasks

4.1. Install Optional Workstation Software

If you are using a Windows workstation, then the following optional software helps the installation process. We recommend that you pre-install the software before continuing with the Trafodion installation:

- putty and puttygen (download from PuTTY web site)
- VNC client (download from RealVNC web site)
- Firefox or Chrome browser
- SFTP client to transfer files from your workstation to the Linux server: WinSCP or FileZilla

4.2. Configure Installation User ID

Trafodion installation requires a user ID with these attributes:

- sudo access per the requirements documented in Linux Installation User.
- passwordless ssh to all nodes on the cluster where Trafodion will be installed.

You may need to request permission from your cluster-management team to obtain this type of access.

The following example shows how to set up your user ID to have "passwordless ssh" abilities.
Do the following on the Provision Master Node:

```bash
echo -e 'y\n' | ssh-keygen -t rsa -N "" -f $HOME/.ssh/id_rsa
cat $HOME/.ssh/id_rsa.pub >> $HOME/.ssh/authorized_keys
echo localhost $(cat /etc/ssh/ssh_host_rsa_key.pub) >> $HOME/.ssh/known_hosts
echo "NoHostAuthenticationForLocalhost=yes" >> $HOME/.ssh/config
chmod 600 $HOME/.ssh/config
chmod 600 $HOME/.ssh/authorized_keys
chmod 700 $HOME/.ssh/
```

After running these commands, do the following:

- If necessary, create the `$HOME/.ssh` directory on the other nodes in your cluster and secure it private to yourself `(chmod 700)`.  
- If necessary, create the `$HOME/.ssh/authorized_keys` file on the other nodes in your cluster. Secure it with `chmod 600 $HOME/.ssh/authorized_keys`.  
- Copy the content of the `$HOME/.ssh/authorized_keys` file on the Provisioning Master Node and append the to the `$HOME/.ssh/authorized_keys` file on the other nodes in your cluster.  
- `ssh` to the other nodes in the cluster. Answer `y` to the prompt asking you whether to continue the connection. This adds the node to the `$HOME/.ssh/known_hosts` file completing the passwordless ssh setup.

### 4.3. Disable requiretty

You need to disable `requiretty` in `/etc/sudoers` on all nodes in the cluster to ensure that `sudo` commands can be run from inside the installation scripts.

Comment out the `Defaults requiretty` setting in the `/etc/sudoers` file to ensure that the `requiretty` option is NOT being used.

### 4.4. Verify OS Requirements and Recommendations

Please ensure that the OS Requirements and Recommendations are met for each node in the cluster where you intend to install Trafodion.
4.5. Configure LDAP Identity Store

If you plan to enable security in Trafodion, then you need to have an LDAP identity store available to perform authentication. The Trafodion Installer prompts you to set up an authentication configuration file that points to an LDAP server (or servers), which enables security (that is, authentication and authorization) in the Trafodion database.

If you wish to manually set up the authentication configuration file and enable security, then refer to the section on Enable Security.

4.6. Gather Configuration Information

You need to gather/decide information about your environment to aid installation Trafodion, both for the Trafodion Installer and for recipe-based provisioning. (Listed in alphabetical order to make it easier to find information when referenced in the install and upgrade instructions.)

<table>
<thead>
<tr>
<th>ID</th>
<th>Information</th>
<th>Default</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMIN</td>
<td>Administrator user name for Apache Ambari or Cloudera Manager.</td>
<td>admin</td>
<td>A user that can change configuration and restart services via the distribution manager's REST API.</td>

<td>Target directory for the Trafodion software.</td>
<td>$HOME_DIR/trafodion</td>
<td>Trafodion is installed in this directory on all nodes in $NODE_LIST.</td>
</tr>
<tr>
<td>START</td>
<td>Whether to start Trafodion after install/upgrade.</td>
<td>N</td>
<td>Does not apply to Recipe-Based Provisioning.</td>
</tr>
<tr>
<td>SUSE_LINUX</td>
<td>Whether your installing Trafodion on SUSE Linux.</td>
<td>false</td>
<td>Auto-detected by the Trafodion Installer.</td>
</tr>
<tr>
<td>TRAF_PACKAGE</td>
<td>The location of the Trafodion installation package tar file or core installation tar file.</td>
<td>None</td>
<td>The package file contains the Trafodion server, DCS, and REST software while the core installation file contains the Trafodion server software only. If you’re using a core installation file, then you need to record the location of the DCS and REST installation tar files, too. Normally, you perform Trafodion provisioning using a Trafodion package installation tar file.</td>
</tr>
<tr>
<td>TRAF_USER</td>
<td>The Trafodion runtime user ID.</td>
<td>trafodion</td>
<td>Must be trafodion in this release.</td>
</tr>
<tr>
<td>TRAF_USER_PASSWORD</td>
<td>The password used for the trafodion:trafodion user ID.</td>
<td>traf123</td>
<td>Must be 6-8 characters long.</td>
</tr>
<tr>
<td>URL</td>
<td>FQDN and port for the Distribution Manager’s REST API.</td>
<td>None</td>
<td>Include http:// or https:// as applicable. Specify in the form: &lt;IP-address&gt;:&lt;port&gt; or &lt;node name&gt;:&lt;port&gt; Example: <a href="https://susevm-1.yourcompany.local:8080">https://susevm-1.yourcompany.local:8080</a></td>
</tr>
</tbody>
</table>

1. The ID matches the environmental variables used in the Trafodion Installation configuration file. Refer to Trafodion Installer for more information.

2. Refer to Enable Security for more information about these security settings.
4.7. Install Required Software Packages

4.7.1. Download and Install Packages

This step is required if you're:

- Installing Trafodion on SUSE.
- Using Recipe-Based Provisioning.
- Can’t download the required software packages using the Internet.

If none of these situations exist, then we highly recommend that you use the Trafodion Installer.

You perform this step as a user with root or sudo access.

Install the packages listed in Software Packages above on all nodes in the cluster. Note the special handling for log4c++. See Install log4c++ below for more information.
4.7.2. Install log4c++

You perform this step as a user with root or sudo access.

This step is required regardless of the Provisioning Options used.

1. Download the log4c++ RPM from the Trafodion Download page.

2. Copy and Install the log4c++ RPM on All Nodes

   Use either rpm -U or yum install.

Example

```sh
# Repeat for all nodes in the cluster from the Provisioning Master Node
scp log4cxx-0.10.0-13.el6.x86_64.rpm <other-node>:$PWD

ssh <other-node>
sudo yum -y install log4cxx-0.10.0-13.el6.x86_64.rpm
exit
```
3. Verify RPM Installation on Every Node

Use the following command to verify that log4c++ has been installed on every node in the cluster.

```bash
# Repeat for all nodes in the cluster
sudo rpm -qa | grep log4cxx
log4cxx-0.10.0-13.el6.x86_64
```

### 4.8. Download Trafodion Binaries

You download the Trafodion binaries from the Trafodion Download page. Download the following packages:

- Trafodion Installer (if planning to use the Trafodion Installer)
- Trafodion Server

You can download and install the Trafodion Clients once you’ve installed and activated Trafodion. Refer to the Trafodion Client Install Guide for instructions.

**Example**

http://apache.cs.utah.edu/incubator/celix/celix-1.0.0.incubating/celix-1.0.0.incubating.tar.gz

```bash
$ mkdir $HOME/trafodion-download
$ cd $HOME/trafodion-download
$ # Download the Trafodion Installer binaries
$ wget http://apache.cs.utah.edu/incubator/trafodion/trafodion-1.3.0-incubating/apache-trafodion-installer-1.3.0-incubating-bin.tar.gz

4.9. Preparation for Recipe-Based Provisioning

This step should be skipped if you plan to use the Trafodion Installer

4.9.1. Modify OS Settings

Ensure that the /etc/security/limits.d/trafodion.conf on each node contains the limits settings required by
Trafodion. Refer to Operating System Changes for the required settings.

4.9.2. Modify ZooKeeper Configuration

Do the following:

1. Modify the ZooKeeper configuration as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxClientCnxns</td>
<td>0</td>
</tr>
</tbody>
</table>

2. Restart ZooKeeper to activate the new configuration setting.
4.9.3. Modify HDFS Configuration

Do the following:

1. Modify the HDFS configuration as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>dfs.namenode.acls.enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

2. Restart HDFS to activate the new configuration setting.

4.9.4. Modify HBase Configuration

Do the following:

1. Modify the HBase configuration as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>hbase.master.distributed.log.splitting</td>
<td>false</td>
</tr>
<tr>
<td>hbase.hregion.impl</td>
<td>org.apache.hadoop.hbase.regionserver.transactional.TransactionalRegion</td>
</tr>
<tr>
<td>hbase.regionserver.region.split.policy</td>
<td>org.apache.hadoop.hbase.regionserver.ConstantSizeRegionSplitPolicy</td>
</tr>
<tr>
<td>hbase.snapshot.enabled</td>
<td>true</td>
</tr>
<tr>
<td>hbase.bulkload.staging.dir</td>
<td>hbase-staging</td>
</tr>
<tr>
<td>hbase.regionserver.region.transactional.tlog</td>
<td>true</td>
</tr>
<tr>
<td>hbase.snapshot.master.timeoutMillis</td>
<td>600000</td>
</tr>
<tr>
<td>hbase.snapshot.region.timeout</td>
<td>600000</td>
</tr>
<tr>
<td>hbase.clientscanner.timeout.period</td>
<td>600000</td>
</tr>
<tr>
<td>hbase.regionserver.lease.period</td>
<td>600000</td>
</tr>
<tr>
<td>hbase.namenode.java.heapsize</td>
<td>1073741824</td>
</tr>
<tr>
<td>hbase.secondary.namenode.java.heapsize</td>
<td>1073741824</td>
</tr>
</tbody>
</table>

   a) Applies to Cloudera distributions only.

2. Restart HBase to activate the new configuration setting.
Chapter 5. Install

This chapter describes how to use the Trafodion Installer to install Trafodion. You use the Trafodion Provisioning ID to run the Trafodion Installer.

Prior to version 2.0.0, you must install log4c++ on all nodes in the cluster prior to running the Trafodion Installer. Refer to Build and Install log4c++ for instructions.

5.1. Unpack Installer

You should already have downloaded the Trafodion Binaries per the instructions in the Download Trafodion Binaries in the Prepare chapter. If not, please do so now.

The first step in the installation process is to unpack the Trafodion Installer tar file.

Example

```bash
$ mkdir $HOME/trafodion-installer
$ cd $HOME/trafodion-downloads
$ tar -zxf apache-trafodion-installer-1.3.0-incubating-bin.tar.gz -C $HOME/trafodion-installer
$ ls $HOME/trafodion-installer/installer
bashrc_default               tools
trafodion_apache_hadoop_install traf_package_setup
build-version-1.3.0.txt       traf_add_user
trafodion_config_default     traf_config_setup
trafodion_install            traf_setup
rest_installer               traf_apache_hadoop_config_setup
trafodion_license            traf_create_systemdefaults
setup_known_hosts.exp        traf_cloudera_mods98
trafodion_uninstaller        traf_hortonworks_mods98
$```

5.2. Automated Install

The --config_file option runs the Trafodion in Automated Setup mode. Refer to Trafodion Installer in the Introduction chapter for instructions of how you edit your configuration file.

Edit your config file using the information you collected in the Gather Configuration Information step in the Prepare chapter.
The following example shows an automated install of Trafodion on a two-node Hortonworks Hadoop cluster.

By default, the Trafodion Installer invokes sqlci so that you can enter the initialize trafodion; command. This is shown in the example below.

Example

1. Run the Trafodion Installer in Automated Setup mode.

```
$ cd $HOME/trafodion-installer/installer
$ ./trafodion_install --config_file my

Trafodion is now running on your Hadoop cluster. Please refer to the Activate chapter for basic instructions on how to verify the Trafodion management and how to perform basic management operations.

5.3. Guided Install

The Trafodion Installer prompts you for the information you collected in the Gather Configuration Information step in the Prepare chapter.

The following example shows a guided install of Trafodion on a two-node Cloudera Hadoop cluster.

By default, the Trafodion Installer invokes sqlci so that you can enter the initialize trafodion; command. This is shown in the example below.

Example

1. Run the Trafodion Installer in guided mode.

   $ cd $HOME/trafodion-installer/installer
   $ ./trafodion_install
   ****************************
   TRAFODION INSTALLATION START
   ****************************

```

Trafodion is now running on your Hadoop cluster. Please refer to the Activate chapter for basic instructions on how to verify the Trafodion management and how to perform basic management operations.
Chapter 6. Upgrade

This chapter describes how to use the Trafodion Installer to upgrade Trafodion. You use the Trafodion Provisioning ID to run the Trafodion Installer.

6.1. Download Updated Trafodion Binaries

You perform this step as the Trafodion Provisioning User.

You download the updated Trafodion binaries from the Trafodion Download page. Download the following packages:

- Trafodion Installer (if planning to use the Trafodion Installer)
- Trafodion Server

Refer to Download Trafodion Binaries in the Prepare chapter for examples.

6.2. Unpack Installer

You perform this step as the Trafodion Provisioning User.

You unpack the updated Trafodion Installer into a new directory.

Example

```
$ mkdir $HOME/trafodion-installer-2.0
$ cd $HOME/trafodion-downloads
$ tar -zxf apache-trafodion-installer-2.0.0-incubating-bin.tar.gz -C $HOME/trafodion-installer
$ ls $HOME/trafodion-installer/installer-2.0
bashrc_default         tools                              traf_config_check
trafodion_apache_hadoop_install traf_package_setup        traf_config_setup
build-version-2.0.0.txt   traf_add_user                     traf_start
trafodion_config_default  traf_setup                      traf_cloudera_mods98
trafodion_hortonworks_mods98
rest_installer           traf_authentication_conf_default   traf_getHadoopNodes
trafodion_license        traf_hortonworks_mods98
setup_known_hosts.exp    traf_config_setup
trasodion_uninstaller
$```

50 | Chapter 6. Upgrade
6.3. Stop Trafodion

You perform this step as the Trafodion Runtime User.

Example

```
$ sudo su trafodion
$ sqstop
Shutting down the REST environment now
stopping rest.
Shutting down the DCS environment now
stopping master.
trafodion-1: stopping server.
trafodion-2: stopping server.
stopped $zlobsrv0
stopped $zlobsrv1
Shutting down (normal) the SQ environment!
Wed Feb 17 05:12:40 UTC 2016
Processing cluster.conf on local host trafodion-1

# of SQ processes: 0
SQ Shutdown (normal) from /home/trafodion Successful
Wed Feb 17 05:12:47 UTC 2016

$
6.4. Automated Upgrade

You perform this step as the Trafodion Provisioning User.

The `--config_file` option runs the Trafodion in Automated Setup mode. Refer to Trafodion Installer in the Introduction chapter for instructions of how you edit your configuration file.

At a minimum, you need to change the following settings:

- LOCAL_WORKDIR
- TRAF_PACKAGE
- SQ_ROOT

Example

```bash
$ cd $HOME/trafodion-configuration
$ cp my_config my_config_2.0
$ # Pre edit content
export LOCAL_WORKDIR="/home/centos/trafodion-installer/installer"
export TRAF_PACKAGE="/home/centos/trafodion-download/apache-trafodion-1.3.0-incubating-bin.tar.gz"
export SQ_ROOT="/home/trafodion/apache-trafodion-1.3.0-incubating-bin"

$ # Use your favorite editor to modify my_config_2.0
$ emacs my_config_2.0
$ # Post edit changes

export LOCAL_WORKDIR="/home/centos/trafodion-installer-2.0/installer"
export TRAF_PACKAGE="/home/centos/trafodion-download/apache-trafodion-2.0.0-incubating-bin.tar.gz"
export SQ_ROOT="/home/trafodion/apache-trafodion-2.0.0-incubating-bin"
```

The following example shows an upgrade of Trafodion on a two-node Hortonworks Hadoop cluster using Automated Setup mode.

> The Trafodion Installer performs the same configuration changes as it does for an installation, including restarting Hadoop services.

Example

1. Run the updated Trafodion Installer using the modified `my_config_2.0` file.
$ cd $HOME/trafodion-installer-2.0/installer
$ ./trafodion_install --config_file $HOME/trafodion-configuration/my_config_2.0

$ Trafodion is now running on your Hadoop cluster. Please refer to the Activate chapter for basic instructions on how to verify the Trafodion management and how to perform basic management operations.
6.5. Guided Upgrade

You perform this step as the Trafodion Provisioning User.

As in the case with an installation, the Trafodion Installer prompts you for the information you collected in the Gather Configuration Information step in the Prepare chapter. Some of the prompts are populated with the current values.

```
export LOCAL_WORKDIR="/home/centos/trafodion-installer/installer" export TRAF_PACKAGE="/home/centos/trafodion-download/apache-trafodion-1.3.0-incubating-bin.tar.gz" export SQ_ROOT="/home/trafodion/apache-trafodion-1.3.0-incubating-bin"
```

The following example shows a guided upgrade of Trafodion on a two-node Cloudera Hadoop cluster.

**Example**

1. Run the updated Trafodion Installer in Guided Setup mode to perform the upgrade. Change information at prompts as applicable.

```
$ cd $HOME/trafodion-installer-2.0/installer
$ ./trafodion_install

<td>4</td>
<td></td>
</tr>
<tr>
<td>MXOSRVR</td>
<td>8</td>
<td>8</td>
<td></td>
</tr>
</tbody>
</table>

Trafodion is now running on your Hadoop cluster. Please refer to the Activate chapter for basic instructions on how to verify the Trafodion management and how to perform basic management operations.
Chapter 7. Activate

7.1. Manage Trafodion

You use the Trafodion runtime user ID to perform Trafodion management operations.

The following table provides an overview of the different Trafodion management scripts.

<table>
<thead>
<tr>
<th>Component</th>
<th>Start</th>
<th>Stop</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>All of Trafodion</td>
<td>sqstart</td>
<td>sqstop</td>
<td>sqcheck</td>
</tr>
<tr>
<td>RMS Server</td>
<td>rmsstart</td>
<td>rmsstop</td>
<td>rmscheck</td>
</tr>
<tr>
<td>REST Server</td>
<td>reststart</td>
<td>reststop</td>
<td>-</td>
</tr>
<tr>
<td>LOB Server</td>
<td>lobstart</td>
<td>lobstop</td>
<td>-</td>
</tr>
<tr>
<td>DCS (Database Connectivity Services)</td>
<td>dcsstart</td>
<td>dcsstop</td>
<td>dcscheck</td>
</tr>
</tbody>
</table>

Example: Start Trafodion

```bash
cd $MY_SQROOT/sql/scripts
sqstart
sqcheck
```

7.2. Validate Trafodion Installation

You can use sqlci (part of the base product) or trafci (requires separate install; see the [Trafodion Client Installation Guide](#)) to validate your installation.

7.2.1. Smoke Test

A simple smoke test to validate that Trafodion is functioning.

```sql
get schemas;
create table table1 (a int);
invoke table1;
insert into table1 values (1), (2), (3), (4);
select * from table1;
drop table table1;
exit;
```
Example

$ sqlci
Apache Trafodion Conversational Interface 1.3.0
Copyright (c) 2015 Apache Software Foundation
>>get schemas;

Schemas in Catalog TRAFODION
============================
SEABASE
_MD_
_REPOS_

--- SQL operation complete.
>>create table table1 (a int);

--- SQL operation complete.
>>invoke table1;

-- Definition of Trafodion table TRAFODION.SEABASE.TABLE1
-- Definition current  Mon Feb 15 07:42:02 2016
(
    SYSKEY     LARGEINT NO DEFAULT NOT NULL NOT DROPPABLE NOT SERIALIZED
    , A          INT DEFAULT NULL SERIALIZE
)

--- SQL operation complete.
>>insert into table1 values (1), (2), (3), (4);

--- 4 row(s) inserted.
>>select * from table1;

A
-------
   1
   2
   3
   4

--- 4 row(s) selected.
>>drop table table1;

--- SQL operation complete.
>>exit;
$
Assuming no errors, your installation has been successful. Next, do the following:

• Install the Trafodion client software. Refer to the Trafodion Client Installation Guide.

• Use Trafodion. Refer to the Trafodion SQL Reference Manual.

• Review other Trafodion documentation. Refer to the Trafodion documentation.

7.3. Troubleshooting Tips

If you are not able to start up the environment or if there are problems running sqlci or trafci, then verify that the all the processes are up and running.

• sqcheck should indicate all processes are running.

If processes are not running as expected, then:

• sqstop to shut down Trafodion. If some Trafodion processes do not terminate cleanly, then run killall.

• sqstart to restart Trafodion.

If problems persist please review logs:

• $MY_SQROOT/logs: Trafodion logs.
Chapter 8. Remove

You use the Trafodion Provisioning User for these instructions.

You do not need to use the `trafodion_uninstaller` script if upgrading Trafodion. Instead, use the `trafodion_install` script, which automatically upgrades the version of Trafodion. Please refer to the Install chapter for further instructions.

Run the commands from the first node of the cluster. Do not run them from a machine that is not part of the Trafodion cluster.

8.1. Stop Trafodion

Do the following:

```
su trafodion
cd $MY_SQROOT/sql/scripts or cds
sqstop
exit
```

Example

```
[admin@trafodion-1 ~]$ su trafodion
[trafodion@trafodion-1 scripts]$ cds
[trafodion@trafodion-1 scripts]$ sqstop
Shutting down the REST environment now
stopping rest.
Shutting down the DCS environment now
stopping master.
trafodion-1: stopping server.
trafodion-2: stopping server.
stopped $zlobsrv0
stopped $zlobsrv1
Shutting down (normal) the SQ environment!
Mon Feb 15 07:49:18 UTC 2016
Processing cluster.conf on local host trafodion-1
```

8.2. Run `trafodion_uninstaller`

The `trafodion_uninstaller` completely removes Trafodion.

Example

```bash
[admin@trafodion-1 ~]$ cd $HOME/trafodion-installer/installer
[admin@trafodion-1 installer]$ ./trafodion_uninstaller
Do you want to uninstall Trafodion (Everything will be removed)? (Y/N) y
***INFO: testing sudo access
***INFO: NOTE, rpms that were installed will not be removed.
***INFO: stopping Trafodion instance
SQ environment is not up.

```
Chapter 9. Enable Security

If you do not enable security in Trafodion, then a client interface to Trafodion may request a user name and password, but Trafodion ignores the user name and password entered in the client interface, and the session runs as the database root user, DB__ROOT, without restrictions. If you want to restrict users, restrict access to certain users only, or restrict access to an object or operation, then you must enable security, which enforces authentication and authorization. You can enable security during installation by answering the Trafodion Installer's prompts or after installation by running the `traf_authentication_setup` script, which enables both authentication and authorization. For more information, see Authentication Setup Script below.

Trafodion does not manage user names and passwords internally but does support authentication via directory servers that support the OpenLDAP protocol, also known as LDAP servers. You can configure the LDAP servers during installation by answering the Trafodion Installer's prompts, or you can configure the LDAP servers manually after installation. For more information, please refer to Configuring LDAP Servers below.

Once authentication and authorization are enabled, Trafodion allows users to be registered in the database and allows privileges on objects to be granted to users and roles (which are granted to users). Trafodion also supports component-level (or system-level) privileges, such as MANAGE_USERS, which can be granted to users and roles. Refer to Manage Users below.

9.1. Configuring LDAP Servers

To specify the LDAP server(s) to be used for authentication, you need to configure the text file `.traf_authentication_config`, located (by default) in `$MY_SQROOT/sql/scripts`. This file is a flat file, organized as a series of attribute/value pairs. Details on all the attributes and values accepted in the authentication configuration file and how to configure alternate locations can be found in `.traf_authentication_config` below.

A sample template file is located in `$MY_SQROOT/sql/scripts/traf_authentication_config`.

Attributes and values in the authentication configuration file are separated with a colon immediately following the attribute name. In general, white space is ignored but spaces may be relevant in some values. Attribute names are always case insensitive. Multiple instances of an attribute are specified by repeating the attribute name and providing the new value. For attributes with only one instance, if the attribute is repeated, the last value provided is used.

```
Attribute1: valueA
Attribute2: valueB
Attribute1: valueC
```
If `Attribute1` has only one instance, `valueC` is used, otherwise, `valueA` and `valueC` are both added to the list of values for `Attribute1`.

Attributes are grouped into sections; this is for future enhancements. Attributes are declared in the `LOCAL` section, unless otherwise specified.

Section names, attribute names, and the general layout of the authentication configuration file are subject to change in future versions of Trafodion and backward compatibility is not guaranteed.

Specification of your directory server(s) requires at a minimum:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Host Name(s)</td>
<td>One or more names of hosts that support the OpenLDAP protocol must be specified. Trafodion attempts to connect to all provided host names during the authentication process. The set of user names and passwords should be identical on all hosts to avoid unpredictable results. The attribute name is <code>LDAPHostName</code>.</td>
<td><code>LDAPHostName: ldap.company.com</code></td>
</tr>
<tr>
<td>LDAP Port Number</td>
<td>Port number of the LDAP server. Typically this is 389 for servers using no encryption or TLS, and 636 for servers using SSL. The attribute name is <code>LDAPPort</code>.</td>
<td><code>LDAPPort: 389</code></td>
</tr>
<tr>
<td>LDAP Unique Identifier</td>
<td>Attribute(s) used by the directory server that uniquely identifies the user name. You may provide one or more unique identifier specifiers.</td>
<td><code>UniqueIdentifier: uid=,ou=users,dc=com</code></td>
</tr>
<tr>
<td>Encryption Level</td>
<td>A numeric value indicating the encryption scheme used by your LDAP server. Values are:</td>
<td><code>LDAPSSL: 2</code></td>
</tr>
<tr>
<td></td>
<td>• 0: Encryption not used</td>
<td>If your LDAP server uses TLS you must specify a file containing the certificate used to encrypt the password. By default the Trafodion software looks for this file in <code>$MY_SQROOT/cacerts</code>, but you may specify a fully qualified filename, or set the environment variable <code>CACERTS_DIR</code> to another directory. To specify the file containing the certificate, you set the value of the attribute <code>TLS_CACERTFilename</code>, located in the <code>Defaults</code> section.</td>
</tr>
<tr>
<td>Search username and password</td>
<td>Some LDAP servers require a known user name and password to search the directory of user names. If your environment has that requirement, provide these “search” values.</td>
<td><code>LDAPSearchDN: lookup@company.com</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>LDAPSearchPwd: Lookup123</code></td>
</tr>
</tbody>
</table>

There are additional optional attributes that can be used to customize Trafodion authentication. As mentioned earlier, they are described in `.traf_directory` below.
You can test the authentication configuration file for syntactic errors using the `ldapconfigcheck` tool. If you have loaded the Trafodion environment (`sqenv.sh`), then the tool automatically checks the file at `$MY_SQROOT/sql/scripts/.traf_authentication_config`. If not, you can specify the file to be checked.

**Example**

```bash
ldapconfigcheck -file myconfigfile
File myconfigfile is valid.
```

If an error is found, then the line number with the error is displayed along with the error. Please refer to `ldapconfigcheck` below for more information.

The authentication configuration file needs to be propagated to all nodes, but there is a script that does that for you described later. For now, you can test your changes on the local node.

You can test the LDAP connection using the utility `ldapcheck`. To use this utility the Trafodion environment must be loaded (`sqenv.sh`), but the Trafodion instance does not need to be running. To test the connection only, you can specify any user name, and a name lookup is performed using the attributes in `.traf_authentication_config`.

```bash
ldapcheck --username=fakename@company.com
User fakename@company.com not found
```

If `ldapcheck` reports either that the user was found or the user was not found, the connection was successful. However, if an error is reported, either the configuration file is not setup correctly, or there is a problem either with your LDAP server or the connection to the server. You can get additional error detail by including the `--verbose` option. Please refer to `ldapcheck` for more information.

If you supply a password, `ldapcheck` attempts to authenticate the specified `username` and `password`. The example below shows the password for illustrative purposes, but to avoid typing the password on the command line, leave the password blank (`--password=`) and the utility prompts for the password with no echo.

```bash
ldapcheck --username=realuser@company.com --password=StrongPassword
Authentication successful
```
9.2. Generate Trafodion Certificate

Trafodion clients such as *trafci* encrypt the password before sending it to Trafodion. A self-signed certificate is used to encrypt the password. The certificate and key should be generated when the `sqgen` script is invoked. By default, the files `server.key` and `server.crt` are located in `$HOME/sqcert`. If those files are not present and since Trafodion clients do not send unencrypted passwords, then you need to manually generate those files. To do so, run the script `sqcertgen` located in `$MY_SQROOT/sql/scripts`. The script runs `openssl` to generate the certificate and key.

To run `openssl` manually, follow the example:

```
openssl req -x509 -nodes -days 365 -subj /C=US/ST=California/L=PaloAlto/CN=host.domain.com/O=Some Company/OU=Service Connection
  - newkey rsa:2048 -keyout server.key -out server.crt
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-x509</td>
<td>Generate a self-signed certificate.</td>
</tr>
<tr>
<td>-days &lt;validity of certificate&gt;</td>
<td>Make the certificate valid for the days specified.</td>
</tr>
<tr>
<td>-newkey rsa:&lt;bytes&gt;</td>
<td>Generate a new private key of type RSA of length 1024 or 2048 bytes.</td>
</tr>
<tr>
<td>-subj &lt;certificateinfo&gt;</td>
<td>Specify the information that is incorporated in the certificate. Each instance in a cluster should have a unique common name(CN).</td>
</tr>
<tr>
<td>-keyout &lt;filename&gt;</td>
<td>Write the newly generated RSA private key to the file specified.</td>
</tr>
<tr>
<td>-nodes</td>
<td>It is an optional parameter that specifies NOT to encrypt the private key. If you encrypt the private key, then you must enter the password every time the private key is used by an application.</td>
</tr>
<tr>
<td>-out &lt;filename&gt;</td>
<td>Write the self-signed certificate to the specified file.</td>
</tr>
</tbody>
</table>

Both the public (`server.crt`) and private (`server.key`) files should be placed in the directory `$HOME/sqcert`. If you do not want to use the `HOME` directory or if you want to use different names for the private and/or public key files, then Trafodion supports environment variables to specific the alternate locations or names.

- Trafodion first checks the environment variables `SQCERT_PRIVKEY` and `SQCERT_PUBKEY`. If they are set, Trafodion uses the fully qualified filename value of the environment variable.

  You can specify either one filename environment variable or both.

- If at least one filename environment variable is not set, Trafodion checks the value of the environment variable `SQCERT_DIR`. If set, then the default filename `server.key` or `server.crt` is appended to the value of the environment variable `SQCERT_DIR`.

- If the filename environment variable is not set and the directory environment variable is not set, then Trafodion uses the default location (`$HOME/sqcert`) and the default filename.
9.3. Authentication Setup Script

The final step to enable security is to change the value of the environment variable `TRAFOYDION_ENABLE_AUTHENTICATION` from **NO** to **YES** and turn on authorization. This is achieved by invoking the `traf_authentication_setup` script, which is located in `$MY_SQROOT/sql/scripts`.

**Usage**

```
Usage: traf_authentication_setup [options]
```

Options:
- `--file <loc>` Optional location of OpenLDAP configuration file
- `--help` Prints this message
- `--off` Disables authentication and authorization
- `--on` Enables authentication and authorization
- `--setup` Enables authentication
- `--status` Returns status of authentication enablement

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--file</strong></td>
<td>If specified, then filename is copied to <code>$MY_SQROOT/</code>. Users working in their own private environment can refer to a site-specific configuration file from a central location.</td>
</tr>
<tr>
<td><strong>--on</strong></td>
<td><code>traf_authentication_setup</code> invokes <code>ldapconfigcheck</code> to verify the configuration file is syntactically correct. It also invokes <code>ldapcheck</code> to verify that a connection can be made to an LDAP server. If both checks pass, the script sets the environment variable <code>TRAFOYDION_ENABLE_AUTHENTICATION</code> to <strong>YES</strong> in the file <code>$MY_SQROOT/sqenvcom.sh</code>, and propagates <code>sqenvcom.sh</code> and <code>.traf_authentication_config</code> to all nodes in the cluster. The last step is to enable authorization by creating privilege-related metadata tables and set up default permissions with a call to the database. The list of privilege-related metadata tables, users, roles, and component privileges are logged in <code>$MY_SQROOT/logs/authEnable.log</code>. Specifying <code>--on</code> requires that a valid <code>.traf_authentication_config</code> file exists and the Trafodion metadata is initialized.</td>
</tr>
<tr>
<td><strong>--off</strong></td>
<td>If specified, then <code>traf_authentication_setup</code> sets the environment variable <code>TRAFOYDION_ENABLE_AUTHENTICATION</code> to <strong>NO</strong> in <code>$MY_SQROOT/sqenvcom.sh</code> and propagates the file to all the nodes in the cluster. The last step is to disable authorization by removing any privilege-related metadata and permissions with a call to the database. The results of this operation is logged in <code>$MY_SQROOT/logs/authEnable.log</code>.</td>
</tr>
<tr>
<td><strong>--setup</strong></td>
<td>Use this option if the Trafodion metadata has not been initialized. This option enables authentication but does not call the database to create privilege-related metadata tables. Later, when Trafodion metadata is initialized, privilege-related metadata tables and default permissions are automatically created.</td>
</tr>
</tbody>
</table>
### Option --status

Reports the value of the environment variable TRAFODION_ENABLE_AUTHENTICATION in $MY_SQROOT/sqenvcom.sh on the current node and reports the status of security features in the database.

### Example

```

INFO: *** Trafodion security (authentication and authorization) status ***
Authentication is ENABLED
Authorization (grant/revoke) is ENABLED

```

Any time the environment file (sqenvcom.sh) is changed (and propagated to all nodes), Database Connectivity Services (DCS) must be restarted to pick up the new value. If the configuration file is changed, it re-reads in 30 minutes (by default), but you can have changes take effect immediately by restarting DCS.

To restart DCS, run the scripts **stop-dcs.sh** and **start-dcs.sh**, located in $MY_SQROOT/dcs-<x>.<y>.<z>/bin.

### 9.4. Manage Users

Users are registered in the Trafodion database and are used to enforce authorization. If security is disabled, any user can register any user at any time. However, once security is enabled, user administration is considered a secure operation, and registration of users is restricted to **DBROOT** or any user granted the MANAGE_USERS component privilege. To initially register a user, connect to Trafodion with the external user mapped to **DBROOT** (also known as the Trafodion ID).

**When security is enabled**, the **DBROOT** user is registered as the TRAFODION external user name. It is recommended that the **DBROOT** user be mapped to the external user name that is used to connect for root operations. To do this, start a sqlci session and perform the ALTER USER command, for example:

```
ALTER USER DB__ROOT SET EXTERNAL NAME trafodion_rootuser_in_ldap;
```

To learn more about how to register users, grant object and component privileges, and manage users and roles, please see the Trafodion SQL Reference Manual.
9.5. .traf_authentication_config

The .traf_authentication_config file is user to enable the Trafodion security features.

9.5.1. File Location

By default, the Trafodion authentication configuration file is located in $MY_SQROOT/sql/scripts/.traf_authentication_config. If you want to store the configuration file in a different location and/or use a different filename, then Trafodion supports environment variables to specify the alternate location/name.

Trafodion firsts checks the environment variable TRAFAUTH_CONFIGFILE. If set, the value is used as the fully-qualified Trafodion authentication configuration file.

If the environment variable is not set, then Trafodion next checks the variable TRAFAUTH_CONFIGDIR. If set, the value is prepended to .traf_authentication_config and used as the Trafodion authentication file.

If neither is set, Trafodion defaults to $MY_SQROOT/sql/scripts/.traf_authentication_config.
9.5.2. Template

# To use authentication in Trafodion, this file must be configured
# as described below and placed in $MY_SQROOT/sql/scripts and be named
# .traf_authentication_config. You must also enable authentication by
# running the script traf_authentication_setup in $MY_SQROOT/sql/scripts.
# 
# NOTE: the format of this configuration file is expected to change in the
# next release of Trafodion. Backward compatibility is not guaranteed.
# 
SECTION: Defaults
  DefaultSectionName: local
  RefreshTime: 1800
  TLS_CACERTFilename:
SECTION: local

# If one or more of the LDAPHostName values is a load balancing host, list
# the name(s) here, one name: value pair for each host.
  LoadBalanceHostName:

# One or more identically configured hosts must be specified here,
# one name: value pair for each host.
  LDAPHostName:

# Default is port 389, change if using 636 or any other port

  MaxExcludeListSize: 3
9.5.3. Configuration Attributes

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Purpose</th>
<th>Example Value</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAPHostName</td>
<td>Host name of the local LDAP server.</td>
<td>ldap.master.com</td>
<td>If more than one LDAPHostName entry is provided, then Trafodion attempts to connect with each LDAP server before returning an authentication error. Also see the description related to RetryCount and RetryDelay entries.</td>
</tr>
<tr>
<td>LDAPPort</td>
<td>Port number of the local LDAP server.</td>
<td>345</td>
<td>Must be numeric value. Related to LDAPSSL entry. Standard port numbers for OpenLDAP are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Non-secure: 389</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• SSL: 636</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• TLS: 389</td>
</tr>
<tr>
<td>LDAPSearchDN</td>
<td>If a search user is needed, the search user distinguished name is specified here.</td>
<td>cn=aaabbb, dc=demo, dc=net</td>
<td>If anonymous search is allowed on the local server, then this attribute does not need to be specified or can be specified with no value (blank). To date, anonymous search is the normal approach used.</td>
</tr>
<tr>
<td>LDAPSearchPWD</td>
<td>Password for the LDAPSearchDN value. See that entry for details.</td>
<td>welcome</td>
<td>None.</td>
</tr>
<tr>
<td>LDAPSSL</td>
<td>A numeric value specifying whether the local LDAP server interface is unencrypted or TLS or SSL. Legal values are 0 for unencrypted, 1 for SSL, and 2 for TLS. For SSL/TLS, see the section below on Encryption Support.</td>
<td>0</td>
<td>None.</td>
</tr>
<tr>
<td>UniqueIdentifier</td>
<td>The directory attribute that contains the user’s unique identifier.</td>
<td>uid=,ou=Users,dc=demo,dc=net</td>
<td>To account for the multiple forms of DN supported by a given LDAP server, specify the UniqueIdentifier parameter multiple times with different values. During a search, each UniqueIdentifier is tried in the order it is listed in the configuration file.</td>
</tr>
<tr>

<td>Specifies the timeout (in seconds) after which the next</td>
<td>20</td>
<td>The value must be a positive number or -1. Setting this to -1 results in an infinite timeout.</td>
</tr>
<tr>
<td></td>
<td>LDAPHostName entry is tried, in case of no response for a</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>connection request. This parameter is similar to NETWORK_TIMEOUT in ldap_conf(5).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default value is 30 seconds.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LDAPTimelimit</td>
<td>Specifies the time to wait when performing a search on the</td>
<td>15</td>
<td>The server may still apply a lower server-side limit on the duration of a search operation.</td>
</tr>
<tr>
<td></td>
<td>LDAP server for the user name. The number must be a positive integer. This parameter is similar to TIMELIMIT in ldap_conf(5).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default value is 30 seconds.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LDAPTimeout</td>
<td>Specifies a timeout (in seconds) after which calls to synchronous LDAP APIs aborts if no response is received. This parameter is similar to TIMEOUT in ldap_conf(5).</td>
<td>15</td>
<td>The value must be a positive number or -1. Setting this to -1 results in an infinite timeout.</td>
</tr>
<tr>
<td></td>
<td>Default value is 30 seconds.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RetryCount</td>
<td>Number of attempts to establish a successful LDAP connection. Default is 5 retries before returning an error.</td>
<td>10</td>
<td>When a failed operation is retried, it is attempted with each configured LDAP server, until the operation is successful or the number of configured retries is exceeded.</td>
</tr>
<tr>
<td>RetryDelay</td>
<td>Specifies the number of 1 seconds to delay between retries. Default value is 2 seconds. See description of RetryCount.</td>
<td>None</td>
<td>None.</td>
</tr>
<tr>
<td>PreserveConnection</td>
<td>Specifies whether the connection to LDAP server is maintained (YES) or closed (NO) once the operation finishes. Default value is NO.</td>
<td>YES</td>
<td>None.</td>
</tr>
</tbody>
</table>
### Provisioning Guide

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Purpose</th>
<th>Example Value</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>RefreshTime</td>
<td>Specifies the number of 3600 seconds that must have elapsed before the configuration file is reread. Default is 1800 (30 minutes).</td>
<td>3600</td>
<td>If set to zero, the configuration file is never read. The connectivity servers must be restarted for changes to take effect if this value is zero. This attribute is not specific to either configuration and must be defined in the DEFAULTS section.</td>
</tr>
<tr>
<td>TLS_CACERTFilename</td>
<td>Specifies the location of the certificate file for the LDAP server(s). Filename can either be fully qualified or relative to $CACERTS_DIR.</td>
<td>cert.pem</td>
<td>This attribute applies to both configurations. If a configuration does not require a certificate, then this attribute is ignored. This attribute must be defined in the DEFAULTS section.</td>
</tr>
<tr>
<td>DefaultSectionName</td>
<td>Specifies the configuration type that is assigned to a user by the REGISTER USER command if no authentication type is specified. In the initial Trafodion release, only one configuration is supported.</td>
<td>LOCAL</td>
<td>This attribute must be defined in the DEFAULTS section. If the DefaultSectionName attribute is specified, then a section by that name (or equivalent) must be defined in .traf_ldapconfig. Legal values are LOCAL and ENTERPRISE. This syntax is likely to change.</td>
</tr>
</tbody>
</table>

### 9.6. ldapcheck

#### 9.6.1. Usage

```bash
ldapcheck [<option>]

<option> ::= --help|-h            display usage information
--username=<LDAP-username>
--password[=<password>]
--primary
--local
--enterprise
--secondary
--remote
--cluster
--verbose

Use first configuration
Use first configuration
Use second configuration
Use second configuration
Use second configuration
Display non-zero retry counts
and LDAP errors
```

#### 9.6.2. Considerations

- Aliases for primary include enterprise and local. Aliases for secondary include cluster and remote. If no configuration is specified, primary is assumed.
- The equals sign is required when supplying a value to username or password.
• To be prompted for a password value with no echo, specify the password argument but omit the equals sign and value.

• Passwords that contain special characters may need to be escaped if the password is specified on the command line or within a script file.

• If the password keyword is not specified, only the username is checked. The tool can therefore be used to test the LDAP configuration and connection to the configured LDAP server(s) without knowing a valid username or password.

9.7. ldapconfigcheck

This page describes the ldapconfigcheck tool, which validates the syntactic correctness of a Trafodion authentication configuration file. Trafodion does not need to be running to run the tool.

9.7.1. Considerations

If the configuration filename is not specified, then the tool looks for a file using environment variables. Those environment variables and the search order are:

1. TRAFAUTH_CONFIGFILE

   A fully qualified name is expected.

2. TRAFAUTH_CONFIGDIR

   Filename .traf_authentication_config/ is appended to the specified directory

3. MY_SQROOT

   /sql/scripts/.traf_authentication_config is appended to the value of MY_SQROOT.
### 9.7.2. Errors

One of the following is output when the tool is run. Only the first error encountered is reported.

<table>
<thead>
<tr>
<th>Code</th>
<th>Text</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>File <code>filename</code> is valid.</td>
</tr>
<tr>
<td>1</td>
<td>File <code>filename</code> not found.</td>
</tr>
</tbody>
</table>
| 2    | File: `filename`  
Invalid attribute name on line `line-number`. |
| 3    | File: `filename`  
Missing required value on line `line-number`. |
| 4    | File: `filename`  
Value out of range on line `line-number`. |
| 5    | File: `filename`  
Open of `traf_authentication_config` file failed. |
| 6    | File: `filename`  
Read of `traf_authentication_config` file failed. |
| 7    | No file provided. Either specify a file parameter or verify environment variables. |
| 8    | TLS was requested in at least one section, but `TLS_CACERTFilename` was not provided. |
| 9    | Missing host name in at least one section.  
Each LDAP connection configuration section must provide at least one host name. |
| 10   | Missing unique identifier in at least one section.  
Each LDAP connection configuration section must provide at least one unique identifier. |
| 11   | At least one LDAP connection configuration section must be specified. |
| 12   | Internal error parsing `.traf_authentication_config`. |
Chapter 10. Install Recipe

To be written.
Chapter 11. Upgrade Recipe

To be written.
